

**How tectonic plates work:**

The earth is made of 4 layers; \_\_\_\_\_, \_\_\_\_\_, \_\_\_\_\_ and \_\_\_\_\_.

The crust is divided up into \_\_\_\_\_.

These plates are dragged and pushed around by the movements in the mantle known as \_\_\_\_\_.

Where they are pushed together a \_\_\_\_\_ happens and where they are pulled apart a \_\_\_\_\_ happens. Where they slide past each other a \_\_\_\_\_ happens.

**sliding boundary, crust, inner core, tectonic plates, destructive boundary, outer core, convection currents, mantle, constructive boundary**
